

February 20, 2018

Dr. Don Rucker  
National Coordinator for Health Information Technology  
Office of the National Coordinator for Health Information Technology  
U.S. Department of Health and Human Services  
200 Independence Ave, SW  
Washington, DC 20201

DELIVERED ELECTRONICALLY

RE: Comments on the draft, "Trusted Exchange Framework and Common Agreement"  
(TEFCA) published on January 5, 2018

Dear Coordinator Rucker:

I am submitting the attached comments on behalf of the American Clinical Laboratory Association (ACLA) in response to the draft, "Trusted Exchange Framework and Common Agreement" (TEFCA) published on January 5, 2018.

ACLA is a not-for-profit association representing the nation's leading clinical and anatomic pathology laboratories, including national, regional, specialty, ESRD, hospital and nursing home laboratories. The clinical laboratory industry employs nearly 277,000 people directly and generates over 115,000 additional jobs in supplier industries. Clinical laboratories are at the forefront of personalized medicine, driving diagnostic innovation and contributing more than \$100 billion to the nation's economy.

ACLA appreciates the opportunity to comment on the draft TEFCA. If there are any questions regarding the above comments, please do not hesitate to contact us by phone at (202) 637-9466 or via e-mail at [tsparkman@acla.com](mailto:tsparkman@acla.com).

Sincerely,

A handwritten signature in blue ink, appearing to read 'Thomas B Sparkman', is written over a light blue horizontal line.

Thomas B Sparkman, RPh, MPP, JD  
Vice President, Government Relations

<b>Page #</b>	<b>Comment</b>
3	<p><b>Text:</b></p> <p>The Cures Act sets an expectation that <b>all of a patient’s health information</b> that is stored electronically will be able to be exchanged. This expectation requires that the industry collectively work towards defining the data that needs to be exchangeable, prioritizing the development of technical standards and implementation guidance to support the exchange of such data, and, ultimately, implementing those capabilities in health IT <b>at the point of care</b>.</p> <p><b>Comment:</b></p> <p>The statement that ‘all of a patient’s health information’ will be able to be exchanged should include an additional notation to incorporate jurisdictional restrictions and patient sharing preferences. However, we do agree that Patient’s should have access to all their own information.</p> <p>The phrase "point of care" may create expectations that laboratories must become a Qualified Health Information Network (QHIN) and submit laboratory results directly to the TEFCA network.</p>

	<p><b>Comment:</b> It appears a google search will find the referenced item on “gop.gov” per hyperlink example below, along with multiple other non-federal references (about 15,000 results for search term above). If possible, it would be helpful for ONC to add a hyperlink for all definitive sources for referenced artifacts throughout the document, or in Appendix.</p> <p><a href="https://www.gpo.gov/fdsys/pkg/CFR-2011-title45-vol1/pdf/CFR-2011-title45-vol1-sec164-504.pdf">https://www.gpo.gov/fdsys/pkg/CFR-2011-title45-vol1/pdf/CFR-2011-title45-vol1-sec164-504.pdf</a></p> <p>Or, alternatively add generic hyperlink to GPO.gov for search: <a href="https://www.gpo.gov/fdsys/search/home.action">https://www.gpo.gov/fdsys/search/home.action</a></p>
7	<p><b>Text:</b> While we applaud the progress made to date and the hard work each organization has contributed to move the industry forward, additional and faster progress must be made; this is particularly true in the case of medical specialties—such as long-term services and supports (LTSS) providing post-acute care or in lieu of institutionalization, behavioral health, and other ambulatory services. Continuing with the status quo will not be enough to ensure these stakeholders have efficient methods for engaging in health information exchange. The Trusted Exchange Framework’s minimum set of policies, procedures, and technical standards are intended to advance interoperability, particularly with these stakeholders, and enable them to use HINs to support the many use cases that are important to them and their patients (clients), including the exchange of data for Treatment, Payment, Health Care Operations (TPO), Individual Access, <b>Public Health</b>, and Benefits Determination. We believe that the proposed Trusted Exchange Framework supports the interoperability goal of reliable information flowing to enable communication among services that make use of Electronic Health Information, ultimately providing stakeholders with greater choice.</p> <p><b>Comment:</b> The phrase "Public Health" may create an expectation that labs must become a Qualified Health Information Network (QHIN) and submit laboratory results directly to the TEFCA network.</p> <p>Please clarify that referencing "Public Health" is not meant to imply that laboratories must additionally report to the TEFCA network and/or replace existing interfaces reporting to EHR Systems established under the EHR Incentive/Meaningful Use Programs, such as the <a href="#">HL7 Version 2.5.1 Implementation Guide: Electronic Laboratory Reporting to Public Health, Release 1 (US Realm)</a> (a.k.a “ELR IG”).</p>
7-8	<p><b>Text:</b> In an effort to develop and support a trusted exchange framework for trusted policies and practices and for a common agreement for the exchange between HINs, the proposed Trusted Exchange Framework supports four important outcomes:</p>

**ACLA Comments on the Draft ONC Trusted Exchange Framework and Common Agreement (TEFCA) provisions**

<b>Comment Item: DRAFT TRUSTED EXCHANGE FRAMEWORK</b>	
<a href="#"><u>Draft Trusted Exchange Framework</u></a>	
<b>Page</b>	<b>Comment</b>
	<p>1) providers can access health information about their patients, regardless of where the patient received care;</p> <p>2) patients can access their health information electronically without any special effort;</p> <p>3) providers and payer organizations accountable for managing benefits and the health of populations can receive necessary and appropriate information on a group of individuals without having to access one record at a time (Population Level Data),<sup>17</sup> which would allow them to analyze population health trends, outcomes, and costs; identify at-risk populations; and track progress on quality improvement initiatives; and</p> <p>4) the health IT community has open and accessible application programming interfaces (APIs) to encourage entrepreneurial, user-focused innovation to make health information more accessible and to improve electronic health record (EHR) usability<sup>1</sup>. All four of these outcomes shall be accomplished in compliance with applicable HIPAA Rules' requirements.</p> <p>In addition, the Trusted Exchange Framework focuses on broadly applicable use cases that are discussed further below. The use cases identified are structured to address the areas of greatest need while also allowing existing HINs and trust frameworks to vary as appropriate to meet more specialized use cases that are specific to their own Participants. We believe that this approach will significantly reduce the need for multiple point-to-point interfaces. As stakeholders noted during the public comment process, these interfaces are costly, complex to create and maintain, and an inefficient use of provider and health IT developer resources. It should be noted that while the Trusted Exchange Framework is structured to create a single “on-ramp” for the most common exchange use cases, it does not prevent organizations from creating point-to-point or one-off agreements between organizations who have a particular business need to exchange data in a manner that is different from the minimum set of policies, procedures, and technical standards outlined in the Trusted Exchange Framework, provided that such agreements do not undermine the policies of the Trusted Exchange Framework<sup>2</sup>.</p> <p><b>Comment:</b>            Since this section references “...significantly reduce the need for multiple point-to-point interfaces...” and “...most common exchange use cases...” please clarify that these statements do not impact existing laboratory results work flows already established under prior EHR</p>

<sup>1</sup> <sup>18</sup> Under Section 4002 of the Cures Act, the Secretary is required under rulemaking to publish application programming interfaces that allows health information from such technology to be accessed, exchanged, and used without special effort through the use of application programming interfaces or successor technology or standards, as provided for under Applicable Law, including providing access to all data elements of a patient’s electronic health record to the extent permissible under applicable privacy laws.

<sup>2</sup> <sup>19</sup> The HIPAA Privacy Rule generally requires Covered Entities to take reasonable steps to limit the use or disclosure of, and requests for, protected health information to the minimum necessary to accomplish the intended purpose unless an exception applies such as for treatment purposes. In certain circumstances, the HIPAA Privacy Rule permits a Covered Entity to rely on the judgment of the party requesting the disclosure as to the minimum amount of information that is needed. Such reliance must be reasonable under the particular circumstances of the request. This reliance is permitted when the request is made by: a public official or agency who states that the information requested is the minimum necessary for a purpose permitted under 45 C.F.R. §164.512 of the Rule, such as for public health purposes (45 C.F.R. §164.512(b)), another Covered Entity or a professional who is a workforce member or Business Associate of the Covered Entity holding the information and who states that the information requested is the minimum necessary for the stated purpose. See generally, 45 C.F.R. §164.502 and 45 C.F.R. §164. 514.

	<p>Incentive/Meaningful Use programs. Laboratories are required to provide laboratory results directly to the patient’s provider(s) by the Clinical Laboratory Improvement Amendments (CLIA). Additionally requiring laboratories to sending an extra copy of the lab result through a QHIN means that there are multiple copies of the patient’s protected health information (PHI) being circulated through these various repositories, which obviously has a multiplier effect on potential data or security breaches.</p> <p>Duplicate copies of laboratory results could unintentionally skew result analysis. Also, laboratories may result interim and/or corrected results causing multiple results to the QHIN. Any network API/queries must be sophisticated enough to filter for the proper combination of results for the patient.</p>
15-16	<p><b>Text:</b></p> <p><b>B. Implement technology in a manner that makes it easy to use and that allows others to connect to data sources, innovate, and use data to support better, more person-centered care, smarter spending, and healthier people.</b></p> <p>Qualified HINs should use standards-based technology for exchanging Electronic Health Information with other Qualified HINs. Such technology should be implemented in accordance with standards and, as consistently as possible, follow implementation guides and authoritative best practices published by the applicable standards development organization (SDO). Minimizing variation in how standards are implemented will make it easier for others to connect to Electronic Health Information. Further, to the extent possible, Electronic Health Information stored in health IT products should be structured and coded using standardized vocabularies. Qualified HINs and their participants should provide accurate translation and adapter services to their End Users to enable them to map proprietary data to standard, user friendly vocabularies. Adapter services are designed to transform message content or, in this context, transform unstructured data to structured and coded vocabularies, so that Qualified HINs can exchange data with other Qualified HINs in a standardized format.</p> <p>Qualified HINs should ensure that the data exchanged within their own network and with other Qualified HINs meets minimum quality standards by using testing and onboarding programs to verify minimum quality levels. Qualified HINs may consider using open source tools, such as ONC’s C-CDA scorecard tool for testing the quality of C-CDAs. They may also consider developing tools to test the quality of data exchange using Fast Healthcare Interoperability Resources (FHIR) APIs. These types of testing programs can help ensure that high quality data is exchanged both within and across HINs</p> <p><b>Comment:</b></p> <p>Please address considerations within the Qualified HIN (QHIN) to support non-standard vocabularies which could be pending assignment within the various terminology standard bodies. For example, LOINC currently only publishes twice a year.</p>

	<p><b>Comment:</b> Section 3 and Section 6 are not “below” in Part 1 Definitions, suggest adding hyperlink, or at minimum the title of the section referred to, e.g. 3. Standardization and 6. Privacy, Security, and Patient Safety in Part B, *or* 2.3 Mandatory Updating of the USCDI and 2.6 Completion of Onboarding Requirements under 2. Requirements of Qualified HINs?</p>
29	<p><b>Text:</b> Record Locator Service (RLS): a service that provides the ability to identify where records are located based upon criteria such as an individual’s demographic data and/or record data type, as well as providing functionality for the ongoing maintenance of this location information.</p> <p><b>Comment:</b> The HL7 January 2018 HL7 Ballot of the US Core Implementation Guide<sup>3</sup>, references StructureDefinition for Patient.gender which has a very ambiguous comment  The gender may not match the biological sex as determined by genetics, or the individual's preferred identification. Note that for both humans and particularly animals, there are other legitimate possibilities than M and F, though the vast majority of systems and contexts only support M and F. Systems providing decision support or enforcing business rules should ideally do this on the basis of Observations dealing with the specific gender aspect of interest (anatomical, chromosomal, social, etc.) However, because these observations are infrequently recorded, defaulting to the administrative gender is common practice. Where such defaulting occurs, rule enforcement should allow for the variation between administrative and biological, chromosomal and other gender aspects. For example, an alert about a hysterectomy on a male should be handled as a warning or overrideable error, not a "hard" error.</p> <p>The statement “....However, because these observations are infrequently recorded, defaulting to the administrative gender is common practice” implies it’s acceptable to use the same field for both administrative and clinical purposes, in fact the ‘Requirements’ statement specifies “Gender...drives many clinical processes”:  Needed for identification of the individual, in combination with (at least) name and birth date. Gender of individual drives many clinical processes.</p> <p>There is a LOINC code for reporting “Sex assigned at birth” (76689-9); however some states now allow patients to change their birth sex on their birth certificate as reported as a comment on the ONC Interoperability Standards Advisory (ISA 2018)<sup>4</sup>.</p>

<b>Comment Item: DRAFT TRUSTED EXCHANGE FRAMEWORK</b>	
<a href="#"><u>Draft Trusted Exchange Framework</u></a>	
<b>Page</b>	<b>Comment</b>
	<p>It seems that inconsistent use of administrative sex (HL7 V2, PID-8), sex assigned at birth (eDOS Implementation Guide<sup>5</sup> and ONC Interoperability Standards Advisory), administrative gender (HL7 V3 and FHIR), and possibly gender identity which supports male to female transsexual (MTF) and female to male transsexual (FTM) reporting (LOINC 76691-5), etc. may cause an issue matching persons/patients, if multiple values are supported in the same field.</p> <p>For example if “Mary Smith” has 5 historical laboratory results with administrative sex (V2) or administrative gender (V3 or FHIR) reported as “F” or “Female”, but the same person also has 3 historical laboratory results with administrative gender reported as “UNK” (per ONC 2015 Edition Certification which might be used for a transgender patient), those results might not be associated in a RLS or query for “Mary Smith’s” laboratory results.</p> <p>The American Clinical Laboratory Association (ACLA) is working on a “best practice” recommendation to present to ONC, since some laboratory results values are dependent on accurate reporting of the patient’s “biological or chromosomal” sex to the laboratory. “Unknown” sex/gender could impact patient safety. For example, abnormal results would not be flagged as high, low, critical in the laboratory result; some laboratory testing is gender specific causing additional burden for the provider to interpret multiple results.</p>
